## Poultry House Monitoring and Exception Reporting

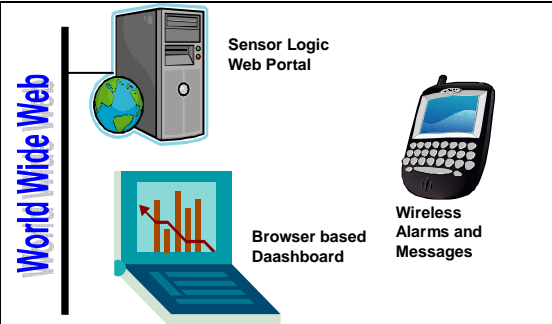

ExceptionTrac watches your operation when you can't. Because poultry operations are physically large you can not be everywhere at once. To provide help for a quick response to equipment failures, the ExceptionTrac monitoring system watches values like water consumption to report a surge that may indicate a nipple leak. Personnel can be notified when levels are exceeded with values like temperature and ammonia to help protect your investment. A Dashboard display viewable with any web-browser allows the current values to be always available on any computer.

To collect the sensor values you need to watch, ExceptionTrac's DaqNode sensor gateway communicates with new sensors, smart meters, and existing controllers at your operation. The DaqNode gateway then pushes these collected sensor values to the Dashboard via internet or cell-phone networks. New sensors could be like a water meter to allowing for leak detection. An existing temperature sensor value might be available on the curtain controller. Retro-Mation can help with determining what sensors are needed to keep watch at your operation.

The ExceptionTrac Dashboard on the Sensor Logic portal allows for a real time view of the site's sensor values via a browser. The Dashboard supports exception reporting like a level exceeding preset value via text, email, and voice messaging. Also Web based reports and trends allow for the sensor values to be analyzed and acted on for improving over all operation.

Contact Retro-Mation today for more information about how monitoring and exception reporting with ExceptionTrac can help save you money.
