## Convenience Store Monitoring and Exception Reporting

ExceptionTrac provides you with electrical and water consumption information with the same daily detail of your POS system. ExceptionTrac monitors water, thermostats, HVAC, lighting, and refrigeration units operation around the clock. Constant monitoring helps ensure equipment runs only when necessary, keeping a lid on energy waste, and pinpointing equipment problems.

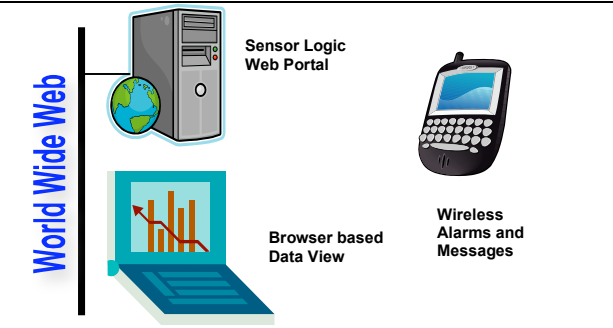

ExceptionTrac Dashboard shows you the current water, thermostats, HVAC, refrigeration and lighting values for any number of facilities from a centralized location. Watching ambient light and canopy light's current, a bad photocell could help be detected long before it shows up on your monthly utility bill thus saving you money. Cooler and case temperatures can be watched to help reduce product spoilage.

To collect the sensor values you need to watch, the ExceptionTrac's DaqNode gateway at each of your facilities communicates with new sensors, smart meters, and existing controllers. The DaqNode gateway then pushes these collected sensor values to the Dashboard via internet or cell-phone networks. New sensors could be an ambient light and canopy lights current to report photocell failure. An existing temperature sensor value might be available on HVAC controllers or walk in coolers. Retro-Mation can help with determining what sensors are needed to keep watch over your facilities.

With ExceptionTrac's Dashboard's view real-time status of your equipment from each of your facilities using a standard desktop web browser. Have maintenance personnel receive real-time exceptions, notifications and historical reports on equipment up-time 24/7. to save money through reducing utilities bills and product spoilage.

Contact Retro-Mation today for more information about how monitoring and exception reporting with ExceptionTrac can help improve your bottom line.
